Problem Statement

We often struggle to discover books that align with our unique preferences

The problem is there's no good way to find books that we would really like.

Proposed Solution

Creating an intelligent computer system that will use data about the reader and the books to suggest books that are an excellent match for them.

We use a Machine Learning Model as it learns from previous input by the user and give recommendation on the basis of previous inputs.

Tech Stack Used

- Python Programming Language
- Streamlit app framework of Python
- Amazon Book dataset

Why?

- **Data Availability**
- **Ethical And Privacy Considerations**
- **Scalability Needs**

Future Scope

- **Multilingual Support**

Expanding system to recommend books in multiple language

- **Marketplace Expansion**

Expanding the platform to allow authors to promote their books and connect directly with readers.

Thank You!
